PRELIMINARY AMENDMENT

Director of the U.S. Patent and Trademark Office
Washington, D. C. 20231

Sir:

Prior to initial examination, please amend the above-identified application as follows:

IN THE CLAIMS:

Please amend claim 5 as followed:

Claim 5, line 3, change "any of claims 1 through 4" to --claim 1--.

REMARKS

Claims 1-7 are pending. Claim 5 has been amended herein. The amendment does not enter new matter. It is respectfully requested the amendment be entered prior to taking the application up for examination. Should the Examiner have any questions, the Examiner is respectfully requested to contact the undersigned at the telephone number listed below.

Respectfully submitted,

METHOD AND SYSTEM FOR UNIFIED MANAGEMENT OF PLURALITY OF
ASSETS USING COMPUTER NETWORK

BACKGROUND OF THE INVENTION

5

1. Field of the Invention

10 The present invention relates to a method and system for
the unified management of a plurality of assets using a
computer network, which enables a user, who has accounts at a
plurality of financial institutions, to automatically and in
real-time obtain without any trouble a portfolio comprising a
plurality of assets.

2. Description of the Related Art

15

20 Services, by which funds are deposited, or stocks and
bonds are bought and sold via an Internet home page, are
being provided as electronic commerce. Furthermore, it is
also possible to obtain balance information on one's own
account. In services such as these, although a user is able
to separately peruse on the Internet the status of asset
information or transactions of his account with a company,
which provides such service, he is not able to simultaneously
obtain the status of asset information and transactions of a
plurality of companies.

25

30 In the utilization and management of assets, there is
used a table, which is called a portfolio, and by which all
asset information is managed by perusal. In the past, a
portfolio was prepared using off-the-shelf asset management
software. A portfolio is also effective when using
electronic commerce, and it is desirable that this portfolio
be capable of being prepared and updated easily and in real-
time. However, when using off-the-shelf asset management
software, it is not possible for a user to grasp the current

overall state of asset information unless he inputs each account transaction himself each time.

SUMMARY OF THE INVENTION

5

An object of the present invention is to solve for such problems by providing a service, which collectively peruses assets at a plurality of different companies, and automatically prepares a portfolio based on the results thereof.

10

According to a method and system for the unified management of a plurality of assets using a computer network related to the present invention, a user's comprehensive asset management is made easier by providing a service, which collectively displays in real-time on the Internet the status of personal assets and transactions.

15

A method for the unified management of a plurality of assets using a computer network related to the present invention comprises the steps of a client computer notifying a financial institution server to send asset information to a unified asset management server; the above-mentioned client computer requesting the above-mentioned unified asset management server to update a portfolio; the above-mentioned unified asset management server requesting the above-mentioned financial institution server for authentication; the above-mentioned financial institution server providing authentication when the above-mentioned unified asset management server is the server specified in the notification from the above-mentioned client computer; the above-mentioned unified asset management server requesting the above-mentioned financial institution server to send the above-mentioned asset information; the above-mentioned financial institution server sending the above-mentioned asset information to the above-mentioned unified asset management

20

25

30

server; the above-mentioned unified asset management server updating a portfolio based on the above-mentioned asset information received; and the above-mentioned unified asset management server sending the updated portfolio to the above-mentioned client computer.

A method for the unified management of a plurality of assets using a computer network related to the present invention comprises the steps of a financial institution server being notified to the effect that an event comprising a deposit/withdrawal process has taken place; the above-mentioned financial institution server notifying a unified asset management server to the effect that asset information will be sent; the above-mentioned financial institution server sending the above-mentioned asset information to the above-mentioned unified asset management server; the above-mentioned unified asset management server updating a portfolio based on the above-mentioned asset information received; and the above-mentioned unified asset management server sending the updated portfolio to the above-mentioned client computer.

A method for the unified management of a plurality of assets using a computer network related to the present invention comprises the steps of a client computer requesting a financial institution server for authentication; the above-mentioned financial institution server providing authentication; the above-mentioned client computer requesting the above-mentioned financial institution server to execute a prescribed transaction; the above-mentioned financial institution server notifying the above-mentioned client computer of the results of the execution of the above-mentioned transaction; the above-mentioned client computer requesting the above-mentioned unified asset management server to update a portfolio; the above-mentioned unified asset management server requesting the above-mentioned

financial institution server for authentication; the above-mentioned financial institution server providing authentication when the request for the above-mentioned authentication by the above-mentioned unified asset

5 management server is made within a prescribed time from the execution of the above-mentioned transaction; the above-mentioned unified asset management server requesting the above-mentioned financial institution server to send the above-mentioned asset information; the above-mentioned
10 financial institution server sending the above-mentioned asset information to the above-mentioned unified asset management server; the above-mentioned unified asset management server updating a portfolio based on the above-mentioned asset information received; and the above-mentioned
15 unified asset management server sending the updated portfolio to the above-mentioned client computer.

A method for the unified management of a plurality of assets using a computer network related to the present invention comprises the steps of a unified asset management
20 server being started up automatically by a timer; the above-mentioned unified asset management server requesting the above-mentioned financial institution server for authentication; the above-mentioned financial institution server providing authentication when the request for the
25 above-mentioned authentication by the above-mentioned unified asset management server was made within a predetermined time period; the above-mentioned unified asset management server requesting the above-mentioned financial institution server to send the above-mentioned asset information; the above-
30 mentioned financial institution server sending the above-mentioned asset information to the above-mentioned unified asset management server; the above-mentioned unified asset management server updating a portfolio based on the above-mentioned asset information received; and the above-mentioned

unified asset management server sending the updated portfolio to the above-mentioned client computer.

Preferably, the method for the unified management of a plurality of assets using a computer network related to the present invention also comprises the step of sending the above-mentioned updated portfolio to an adviser server in order to receive advice.

A unified asset management system related to the present invention comprises a plurality of assets databases corresponding to a plurality of financial institutions; a plurality of authentication information databases corresponding to the above-mentioned plurality of financial institutions; a portfolio database for storing portfolio information related to total assets in the above-mentioned plurality of financial institutions; a unified asset management server for receiving asset information from the above-mentioned plurality of financial institutions and storing same respectively in the above-mentioned plurality of asset databases, and, in addition, for preparing the above-mentioned portfolio based on the above-mentioned plurality of asset databases and storing same in the above-mentioned portfolio database; an authentication database for performing user authentication; an asset management database for managing a user's assets; a transaction management database for storing transaction information related to a user's assets; an event notification unit, which, when a transaction occurs, notifies the above-mentioned unified asset management server to that effect; and a financial institution server connected to the above-mentioned authentication database, the above-mentioned asset management database, and the above-mentioned transaction management database, and the above-mentioned financial institution server sends asset information to the above-mentioned unified asset management

server after the notification of the above-mentioned event notification unit.

A unified asset management system related to the present invention comprises a plurality of assets databases
5 corresponding to a plurality of financial institutions; a plurality of authentication information databases corresponding to the above-mentioned plurality of financial institutions; a portfolio database for storing portfolio information related to total assets in the above-mentioned
10 plurality of financial institutions; a clock/calendar apparatus; a unified asset management server for receiving asset information from the above-mentioned plurality of financial institutions and storing same respectively in the above-mentioned plurality of asset databases, and, in
15 addition, for preparing the above-mentioned portfolio based on the above-mentioned plurality of asset databases and storing same in the above-mentioned portfolio database; an authentication database for performing user authentication; an asset management database for managing a user's assets; a
20 transaction management database for storing transaction information related to a user's assets; a second clock/calendar apparatus; and a financial institution server connected to to the above-mentioned authentication database, the above-mentioned asset management database, and the above-
25 mentioned transaction management database, and the above-mentioned unified asset management server receives a signal from the above-mentioned clock/calendar apparatus, and requests the above-mentioned financial institution server to send asset information, and the above-mentioned financial
30 institution server receives a signal from the above-mentioned second clock/calendar apparatus and based on this signal makes a determination as to whether or not the request from the above-mentioned unified asset management server was made in a predetermined period of time, and, in addition, sends

the above-mentioned asset information on the basis of the results of this determination.

Storage media related to the present invention store programs for achieving the above-mentioned methods/systems.

5 The media comprise, for example, floppy disks, hard disks, magnetic tape, magneto-optical discs, CD-ROM, DVD, ROM cartridges, RAM memory cartridges equipped with battery backup, flash memory cartridges, and nonvolatile RAM cartridges and the like.

10 Further, the present invention comprises telecommunications media, such as telephone lines and other wired telecommunications media, and microwave circuits and other wireless telecommunications media. The Internet is also included in the telecommunications media referred to
15 here.

A medium is something on which information (mainly digital data, programs) is stored by some physical means or another, and something, which enables a prescribed function to be performed by a computer, dedicated processor, or other
20 processing device. In other words, a medium can be anything that downloads a program to a computer by some means or another, and causes the execution of a prescribed function.

BRIEF DESCRIPTION OF THE DRAWINGS

25 Fig. 1 is a diagram showing the simplified constitutions of a unified asset management server and financial institution server related to an aspect of the embodiment of the present invention;

30 Fig. 2 is a diagram showing the overall constitution of a system of an aspect of the embodiment of the present invention;

Fig. 3 is an example of a portfolio screen of an aspect of the embodiment of the present invention;

Fig. 4 is an example of a portfolio screen of an aspect of the embodiment of the present invention;

5 Fig. 6 is a diagram showing another processing procedure in an aspect of the embodiment of the present invention;

Fig. 7 is a diagram showing another processing procedure in an aspect of the embodiment of the present invention; and

10 Fig. 8 is a diagram showing another processing procedure in an aspect of the embodiment of the present invention.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

15 The aspects of the embodiment of the present invention will be explained utilizing the figures.

Fig. 1 is a block diagram of a system of an aspect of the embodiment of the present invention. Fig. 2 is an illustration showing a utilization configuration of this system. As shown in Fig. 2, a unified asset management
20 server 2 and a database 3 thereof related to an aspect of the embodiment of the present invention are connected to the Internet 6. The unified asset management server 2 receives a request from a client 1, and prepares and sends a portfolio thereof, and, in addition, sends this portfolio to an advisor
25 server 5 as needed. The advisor server 5 analyzes the received portfolio, and sends an advice message to the client 1. The unified asset management server 2 accesses the servers 4-1 through 4-4 of banks, a securities firm, and an investment trust company at which the client 1 has accounts, and acquires the asset information of this client. By using
30 the unified asset management server 2 in this manner, a user can collectively peruse on the Internet, and in real-time, the status of transactions and assets held by a plurality of different companies in accordance with manual/automatic

updates. Perusal is possible via a home personal computer or an Internet mobile computing device by inputting beforehand the ID and password of each user. Of course, it is also possible to move from a perused page to the online trade home page (HP) of a securities firm with which the user has an account. Furthermore, by sending a portfolio to an advisor server 5, it is also possible to receive advice by a financial planner (FP) based on comprehensive, up-to-date asset information.

Next, Fig. 1 will be explained. As explained hereinabove, the unified assets management server 2 performs data communications with the Bank A server 4-1, but for the sake of expediting the explanation, Internet and other displays are omitted in Fig. 1. The systems of other financial institutions are the same as Fig. 1. The left side of Fig. 1 shows the constitution of a unified asset management server, and the right side of the figure shows the constitution of the Bank A server 4-1.

The unified asset management server 2a of Fig. 1 prepares and sends a client's portfolio in accordance with a request from this client, and, in addition, manually/automatically receives this client's asset information from each financial institution's server. Data related to the received asset information is stored in a database 3b. The database 3b stores authentication information comprising an ID and password for accessing each financial institution's server. Authentication information is provided beforehand by a client 1. The unified asset management server 2a accesses the server of each financial institution based on the above-mentioned authentication information, and obtains the data of the asset information of this client. Based on the obtained data, the unified asset management server 2a prepares this client's portfolio. Fig. 3 and Fig. 4 show examples of portfolios. Because a

portfolio of a client's total estate is displayed as in Fig. 4, a client can easily carry out his own asset management. In the past, a client had to input this kind of portfolio into the computer himself while looking at notifications from financial institutions. However, thanks to the unified asset management server 2a manually/automatically obtaining asset information from each financial institution, portfolio preparation is no longer any trouble. Furthermore, the timing at which the unified asset management server 2a obtains this client's asset information from each financial institution is when there was a request from a client, and/or when a notification was received from a financial institution, and/or at a prescribed time specified by a clock/calendar apparatus 2b. Details will be given hereinbelow.

The Bank A server 4a of Fig. 2 is connected to an authentication database 4b, an asset management database 4c and a transaction management database 4d. The Bank A server 4a performs authentication based on the authentication database 4b, and, in addition, sends asset information and/or transaction information to an authenticated user. The Bank A server 4a carries out authentication based on authentication data, as well as information from a clock/calendar apparatus 4e. An event notification unit 4f sends a notification to the unified asset management server 2a each time there is a transaction when there is a request or contract from a client beforehand to the effect that such a notification is desired.

Next, operation will be explained. A user opens an account at a financial institution, and, in addition, acquires in advance an ID and password for Internet transactions. The ID and password are also sent to a unified asset management server. Furthermore, it is desirable that either a notification or a contract be concluded in advance to the effect that there will be requests to the financial

institution from the unified asset management server
beforehand for the sending of asset information.

There are a number of procedures by which a unified
asset management server 2a obtains client asset information
5 from a financial institution. These procedures will be
explained in order hereinbelow.

(1) When there is a request from a client to a unified asset
management server

This situation will be explained by referring to Fig. 5.

10 When a user accesses a unified asset management server and
attempts to obtain an up-to-date portfolio, firstly, a prior
notification is sent out by the client to the Bank A server
so that the latest asset information will be sent to the
unified asset management server (S1). This is so asset
15 information is not provided unnecessarily. There could also
be a case in which a third party would attempt to obtain
asset information without authorization, and there could also
be a case in which the unified asset management server would
attempt to obtain asset information on its own in violation
20 of the contract with the user. By carrying out a prior
notification, a user can control the disclosure of his asset
information. The Bank A server makes a determination as to
whether or not a request is from a real client based on an
Internet protocol (IP) address and authentication information
25 from a client. When there are a plurality of financial
institutions, prior notifications are made to each
(thereafter, the procedure is the same).

When there is a notification from the Bank A server
acknowledging the prior notification (S2), the client
30 requests the unified asset management server to update and
display a portfolio (S3). Upon receiving this request, the
unified asset management server requests authentication from
the Bank A server (S4), and after authentication (S5),
requests updated information related to assets (S6), and upon

obtaining the required information (S7), requests termination (S8). Furthermore, the Bank A server can be constituted so as to provide authentication only when an authentication request is made (S4) within a prescribed time following prior notification (S1). Establishing a prior notification term of validity like this is desirable from the standpoint of security.

Once termination is confirmed (S9), the unified asset management server updates the portfolio (S10), and, in addition, sends an updated portfolio screen to the client (S11).

(2) When a transaction is generated by a financial institution

This situation will be explained by referring to Fig. 6. When an event, such as a funds transfer from a third party, or an automatic debit is performed for a client account at Bank A, a notification to this effect is sent to the event notification unit 4f of Fig. 1 (S20). The event notification unit 4f notifies the unified asset management server of the fact that an event has taken place (S21). The IP address and authentication information of the unified asset management server have been communicated to the Bank A server beforehand. Following acknowledgment by the unified asset management server (S22), the Bank A server communicates the update information (S23). After receiving a receipt notification from the unified asset management server (S24), the Bank A server executes a termination procedure (S25, S26).

Thereafter, the unified asset management server updates the portfolio (S27), and upon receiving a portfolio update display request from the client (S28), sends the updated screen to the client (S29). Furthermore, when a portfolio is updated, the unified asset management server can be constituted so as to notify the client to the effect that updating has been performed.

According to the procedures of Fig. 6, it is possible to prepare a portfolio that reflects a transaction in real-time. Further, according to this procedure, the party is clearly identified for sending information from a financial institute to the unified asset management server, making it desirable from the aspect of security.

(3) When a client carries out a transaction at a financial institution

This situation will be explained by referring to Fig. 7.

A client requests Bank A to perform a transaction (S30 through S35). Thereafter, the client makes a request to the unified asset management server to update the portfolio since a transaction was carried out at Bank A (S36). Upon receiving this request, the unified asset management server requests authentication from the Bank A server (S37), and after authentication (S38), requests updated information related to assets (S39), and upon obtaining the required information (S40), requests termination (S41). Furthermore, the Bank A server can be constituted so as to provide authentication only when an authentication request is made (S37) within a prescribed time following transaction generation notification (S36). Establishing a prior notification term of validity like this is desirable from the standpoint of security.

Once termination is confirmed (S42), the unified asset management server updates the portfolio (S43), and, in addition, in accordance to a request (S44), sends an updated portfolio screen to the client (S45).

(4) At a predetermined time, such as the beginning or end of a term

This situation will be explained by referring to Fig. 8. The unified asset management server is automatically started up by a timer (S50), and sends a request for authentication to the Bank A server (S51). The Bank A server performs this authentication within a period determined in advance with the

user, for example, at the beginning or end of a term, or the end of the month (S53). The Bank A server will not perform authentication when a request is not within the period determined beforehand. Because the unified asset management server performs the procedures of Fig. 8 automatically without instructions from a client, strict authentication is desirable.

Following authentication (S53), the unified asset management server requests updated information related to assets (S54), and upon obtaining the required information (S55), requests termination (S56).

When termination has been confirmed (S57), the unified asset management server updates the portfolio (S58), notifies the client of the update, and, in addition, sends the portfolio to an advisor as needed (S60a). This is to receive an advisor's advice when the portfolio is updated at the beginning or end of a term. The unified asset management server, in accordance with a request from the client (S61), sends the client an updated portfolio screen (S62). Furthermore, the procedures can be constituted such that the client notifies an advisor manually (S60b).

As explained hereinabove, according to a system/method of an aspect of the embodiment of the present invention, a user can peruse on the Internet and in real-time via automatic updating the status of transactions and assets held in a plurality of different companies.

The present invention is extremely convenient, enabling each user, by inputting an ID and a password, to peruse his portfolio using a home personal computer or an Internet-enabled mobile computing device. Further, it also makes it possible to move from a perused page to the online trading HP of a securities firm or the like with which a user has an account.

The present invention also makes it possible to use an up-to-date portfolio to receive advice from a financial planner (FP) based on comprehensive, up-to-the-minute asset information.

5 The aspects of the embodiment of the present invention make it possible to provide heretofore-nonexistent services, whereby assets held by a plurality of different companies can be collectively perused. In particular, according to the aspects of the embodiment of the present invention, security
10 is also high since in addition to ID and password authentication, authentication is also performed on the basis of whether or not there has been a user request, and/or, using a signal from a clock/calendar apparatus, whether or not a request for the sending of asset information was made
15 at the proper time.

 The unified asset management server can be positioned as a portal site for so-called personal asset management, and is expected to attract numerous users. An individual can constantly have an up-to-date portfolio provided
20 automatically by simply registering his financial institutions in the unified asset management server. Unified asset management server-based services can be received either free of charge or at a reasonable cost. This is because the unified asset management server is positioned as a portal
25 site. For example, even if portfolio preparation costs are not obtained from users, server operating costs can be obtained by displaying banner advertisements on the portal site, and introduction fees can be obtained by introducing users to appropriate financial institutions in accordance
30 with requests. This is made possible due to the fact that a unified asset management server can be constituted as a portal site for personal asset management through the preparation of personal portfolios.

The present invention is not limited to the above-mentioned aspects of the embodiment, and is capable of various modifications within the scope of the inventions disclosed in the claims. Naturally, these variations will
5 also fall within the scope of the present invention.

Further, in this specification, means does not always signify physical means, but rather also includes cases in which the function of each means is achieved via software. Furthermore, the function of one means can be achieved by two
10 or more physical means, or the functions of two or more means can be achieved by one physical means.

What Is Claimed Is:

1. A method for the unified management of a plurality of assets using a computer network, comprising the steps of:
5 a client computer notifying a financial institution server to send asset information to a unified asset management server;

said client computer making a request to said unified asset management server to update a portfolio;

10 said unified asset management server making a request to said financial institution server to perform authentication;

said financial institution server providing authentication when said unified asset management server is
15 the server specified in the notification from said client computer;

said unified asset management server making a request to said financial institution server to send said asset information;

20 said financial institution server sending said asset information to said unified asset management server;

said unified asset management server updating a portfolio based on said asset information received; and

25 said unified asset management server sending an updated portfolio to said client computer.

2. A method for the unified management of a plurality of assets using a computer network, comprising the steps of:

30 a financial institution server being notified to the effect that an event comprising a deposit/withdrawal process has taken place;

said financial institution server notifying a unified asset management server to the effect that asset information will be sent;

said financial institution server sending said
asset information to said unified asset management server;
said unified asset management server updating a
portfolio based on said asset information received; and
5 said unified asset management server sending an
updated portfolio to a client computer.

3. A method for the unified management of a plurality
of assets using a computer network, comprising the steps of:

10 a client computer making a request to a financial
institution server to perform authentication;

said financial institution server providing
authentication;

15 said client computer making a request to said
financial institution server to execute a prescribed
transaction;

said financial institution server notifying said
client computer of the results of the execution of said
transaction;

20 said client computer making a request to said
unified asset management server to update a portfolio;

said unified asset management server making a
request to said financial institution server to perform
authentication;

25 said financial institution server providing
authentication when the request for said authentication by
said unified asset management server is made within a
prescribed time from the execution of said transaction;

30 said unified asset management server making a
request to said financial institution server to send said
asset information;

said financial institution server sending said
asset information to said unified asset management server;

said unified asset management server updating a portfolio based on said asset information received; and
said unified asset management server sending an updated portfolio to said client computer.

5

4. A method for the unified management of a plurality of assets using a computer network, comprising the steps of:
a unified asset management server being started up automatically by a timer;

10 said unified asset management server making a request to said financial institution server to perform authentication;

said financial institution server providing authentication when the request for said authentication by
15 said unified asset management server was made within a predetermined time period;

said unified asset management server making a request to said financial institution server to send said asset information;

20 said financial institution server sending said asset information to said unified asset management server;

said unified asset management server updating a portfolio based on the received said asset information; and

25 said unified asset management server sending an updated portfolio to said client computer.

5. The method for the unified management of a plurality of assets using a computer network according to any of claims 1 through 4, further comprising the step of sending
30 said updated portfolio to an adviser server in order to receive advice.

6. A unified asset management system comprising:

a plurality of assets databases corresponding to a plurality of financial institutions;

a plurality of authentication information databases corresponding to said plurality of financial institutions;

5 a portfolio database for storing portfolio information related to total assets in said plurality of financial institutions;

10 a unified asset management server for receiving asset information from said plurality of financial institutions and storing same respectively in said plurality of asset databases, and, in addition, for preparing said portfolio based on said plurality of asset databases and storing same in said portfolio database;

15 an authentication database for performing user authentication;

an asset management database for managing a user's assets;

a transaction management database for storing transaction information related to a user's assets;

20 an event notification unit, which, when a transaction occurs, notifies said unified asset management server to that effect; and

25 a financial institution server which is connected to said authentication database, said asset management database, and said transaction management database;

wherein said financial institution server sends asset information to said unified asset management server after the notification from said event notification unit.

30 7. A unified asset management system comprising:

a plurality of assets databases corresponding to a plurality of financial institutions;

a plurality of authentication information databases corresponding to said plurality of financial institutions;

a portfolio database for storing portfolio information related to total assets in said plurality of financial institutions;

a clock/calendar apparatus;

5 a unified asset management server for receiving asset information from said plurality of financial institutions and storing same respectively in said plurality of asset databases, and, in addition, for preparing said portfolio based on said plurality of asset databases and
10 storing same in said portfolio database;

an authentication database for performing user authentication;

an asset management database for managing a user's assets;

15 a transaction management database for storing transaction information related to a user's assets;

a second clock/calendar apparatus; and

a financial institution server connected to said authentication database, said asset management database, and
20 said transaction management database,

wherein said unified asset management server receives a signal from said clock/calendar apparatus, and makes a request to said financial institution server to send asset information, and said financial institution server
25 receives a signal from said second clock/calendar apparatus and based on this signal makes a determination as to whether or not the request from said unified asset management server was made within a predetermined period of time, and, in addition, sends said asset information on the basis of the
30 results of this determination.

ABSTRACT OF THE DISCLOSURE

A method and system for collectively displaying in real-time on the Internet the status of personal assets and transactions. The system comprises a plurality of asset databases corresponding to a plurality of financial institutions; a plurality of authentication information databases corresponding to the above-mentioned plurality of financial institutions; a portfolio database for storing portfolio information related to total assets in the above-mentioned plurality of financial institutions; a clock/calendar apparatus; a unified asset management server for receiving asset information from the above-mentioned plurality of financial institutions and storing same respectively in the above-mentioned plurality of asset databases, and, in addition, for preparing the above-mentioned portfolio based on the above-mentioned plurality of asset databases and storing same in the above-mentioned portfolio database; an authentication database for performing user authentication; an asset management database for managing a user's assets; a transaction management database for storing transaction information related to a user's assets; a second clock/calendar apparatus; and a financial institution server connected to the above-mentioned authentication database, the above-mentioned asset management database, and the above-mentioned transaction management database. The unified asset management server prepares a portfolio of all assets.

APPLICATION FOR UNITED STATES PATENT DECLARATION AND POWER OF ATTORNEY

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name; that

I verily believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural inventors are named below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:
METHOD AND SYSTEM FOR UNIFIED MANAGEMENT OF PLURALITY OF ASSETS USING COMPUTER NETWORK

described and claimed in the specification:

Check one

*a. ☒ attached hereto.

b. ☐ filed on _____ as Application _____ and amended on _____ (if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose to the Office all information known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, § 1.56.

Under Title 35, U.S. Code § 119, the priority benefits of the following foreign application(s) and/or United States provisional application(s) filed by me or my legal representatives or assigns within one year prior to this application are hereby claimed:

Number
2000-152602

Country
Japan

Day/Month/Year filed
24/5/2000

The following application(s) for patent or inventor's certificate on this invention were filed in countries foreign to the United States of America either (a) more than one year prior to this application, or (b) before the filing date of the above-named foreign priority application(s) and/or United States provisional application(s):

I hereby appoint the following as my attorneys of record with full power of substitution and revocation to prosecute this application and to transact all business in the Patent Office:

James A. Oliff, Reg. No. 27,075; William P. Berridge, Reg. No. 30,024;

Kirk M. Hudson, Reg. No. 27,562; Thomas J. Pardini, Reg. No. 30,411;

Edward P. Walker, Reg. No. 31,450; Robert A. Miller, Reg. No. 32,771;

Mario A. Constantino, Reg. No. 33,565; and Stephen J. Roe, Registration No. 34,463.

ALL CORRESPONDENCE IN CONNECTION WITH THIS APPLICATION SHOULD BE SENT TO OLIFF & BERRIDGE, P.L.C., P.O. BOX 19928, ALEXANDRIA, VIRGINIA 22320, TELEPHONE (703) 838-6400.

I hereby declare that I have reviewed and understand the contents of this Declaration, and that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
